# Vendor onboarding: collecting the documents, verifying them, and chasing what is missing

Most of the work is the chase, and most of the failure is a document that is present but wrong.

## THE JOB

Your AI Employee runs a vendor from first contact to a clean, verified record. It collects the document set, checks each one for validity and expiry, cross-checks the details that should agree across documents, chases the gaps by email, and hands the master data team a record they can create without follow-up questions.

## WHERE IT BREAKS

- Documents are individually valid and mutually inconsistent. The legal name on the GST certificate differs from the name on the cancelled cheque by one word.
- An expiry date is the most common silent failure. A certificate that lapsed last month still looks like a certificate.
- Vendors go quiet. Knowing when to chase again, and when to stop chasing and escalate, is part of the build.
- The vendor may already exist on the master under a different spelling.

## WHAT YOU ARE GIVEN

Onboarding requests raised by buyers, the document sets vendors have emailed in, some clean and some broken, document requirements by vendor type, a verification rule set with the chase cadence, an existing vendor master extract, and live email threads where vendor replies arrive after you chase. Open 00_START_HERE.pdf in the statement folder first.

## WHAT TO BUILD

**Round 1 minimum** Scored under Does the Auto work. Includes one declared exception, live.

- Take requests for equipment rental and civil works only, with the documents emailed in.
- Check each document is present and in date, and that names, PAN, GSTIN and bank agree.
- Search the master by PAN, GSTIN and bank account; send a likely duplicate to a human.
- Chase once naming the exact gap, re-check the reply, and hand over a verified pack.

**Strong** The other main rules and exceptions.

- Validate the numbers themselves: GSTIN check character, PAN type, IFSC, state code, Udyam.
- Run the chase cadence in working days, escalate after two rounds, and judge renewal receipts.

**Stretch** Everything else, if you have time left.

- Cover every vendor type, sets split across emails or forwarded by buyers, and labour licences.

### EXCEPTIONS WORTH DECLARING

Round 1 scores an entry only if it declares one exception and shows the AI Employee handling it. Declare your own. These four are the ones this operation actually throws.

- Two valid documents that contradict each other.
- A certificate that expired with a renewal receipt attached.
- A vendor that already exists under a different spelling.
- A vendor who stops replying halfway through.

### WHAT A HUMAN STILL APPROVES

Approving any vendor that still carries an unresolved exception, every duplicate merge or extension of an existing vendor, and accepting a renewal receipt in place of a certificate.

### OUT OF SCOPE

Creating the record in the ERP is out. You hand over a verified pack.

### HOW THIS IS JUDGED

| | | |
|---|---|---|
| 40 | **Does the Auto work** | Evaluators run it live on records held back from the pack. It finishes the Round 1 minimum with no help from the builder. |
| 25 | **The demo** | Five minutes on the running Auto: what it does, who it is for, what it saves. |
| 20 | **Can someone else run it** | Its record shows what it decided alone and what it escalated. A function owner could run it. |
| 15 | **Does it fit the real problem** | It handles the operation as it actually runs, messy inputs included. Strong and Stretch work earns these points. |

**Hard gate: a team that cannot run its Auto live cannot place in the top three, whatever the pitch looks like.**

### WHAT YOU SUBMIT IN ROUND 1

A five minute screen recording with your voice on it, a link to your Auto workspace, and the one page brief on the published template: the job, the trigger, the rule, the systems, the exception you declared, what a human still approves, the level you reached, and how an evaluator sends your Auto a new record. Solo or in a pair.

### IF YOU REACH ROUND 2

Round 2 asks every shortlisted team for the layer above one AI Employee: several AI Employees splitting collection, verification and the chase, Auto Policies deciding what may be approved without a human, and a console showing every vendor's state and what each one is waiting on. Auto Policies are business rules a function owner can read and change without touching the build, and a console is the screen the operation is run from. The full brief, including the change every team receives at a fixed hour, comes with the shortlist.
